DETAILED ACTION

Double Patenting

1. A rejection based on double patenting of the "same invention" type finds its support in the language of 35 U.S.C. 101 which states that "whoever invents or discovers any new and useful process ... may obtain a patent therefor ..." (Emphasis added). Thus, the term "same invention," in this context, means an invention drawn to identical subject matter. See *Miller v. Eagle Mfg. Co.*, 151 U.S. 186 (1894); *In re Ockert*, 245 F.2d 467, 114 USPQ 330 (CCPA 1957); and *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970).

A statutory type (35 U.S.C. 101) double patenting rejection can be overcome by canceling or amending the conflicting claims so they are no longer coextensive in scope. The filing of a terminal disclaimer cannot overcome a double patenting rejection based upon 35 U.S.C. 101.

2. Claim 48 is rejected under 35 U.S.C. 101 as claiming the same invention as that of claim 1 of prior U.S. Patent No. 5,807,263. This is a double patenting rejection.

The respective claims constitute the same invention because they claim identical subject matter and the current claim cannot be literally infringed without literally infringing the corresponding patent claim.

Both claims require a spectroscopic system for imaging biological tissue having multiple input ports arranged to introduce light at input locations into biological tissue and multiple detection ports arranged to collect light from detection locations of the biological tissue with at least one light source, operatively connected to a radiation pattern controller, constructed to generate light of a wavelength in a range from visible to infrared, the light source being optically coupled to at least one of said input ports and at least one detector, operatively connected to said radiation pattern controller, constructed and arranged to detect light of the wavelength that has migrated in the tissue region to at least one detection location and corresponding at least one of the detection ports; and a processor operatively connected to

receive detector signals from the detector and provide an image. The processor of the patented claim is necessarily required in the current claim to determine the influence of the photon density in order to create an image and hence this is an inherent feature.

Conclusion

3. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Knutson et al.'582 teach a method and an apparatus for localization and spectroscopy of objects.

Chance'574 teach a system for tissue examination.

Chance'324 teach examination and imaging of a biological tissue.
